

Module 15 - chapter 3

Setup Managed Server to Configure with Ansible

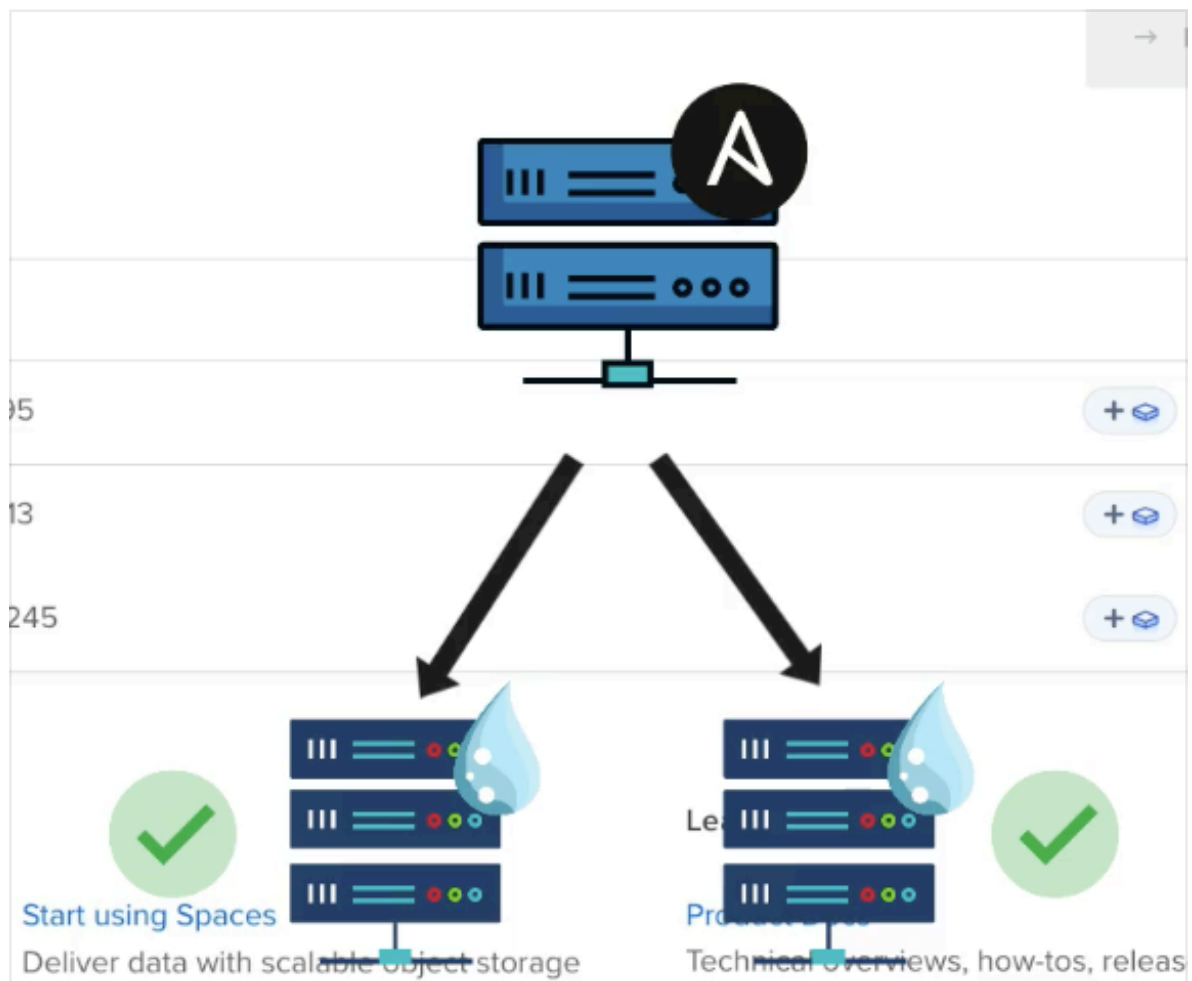

We will create 2 server in DigitalOcean so they can be configured with Ansible, they will be the target servers.

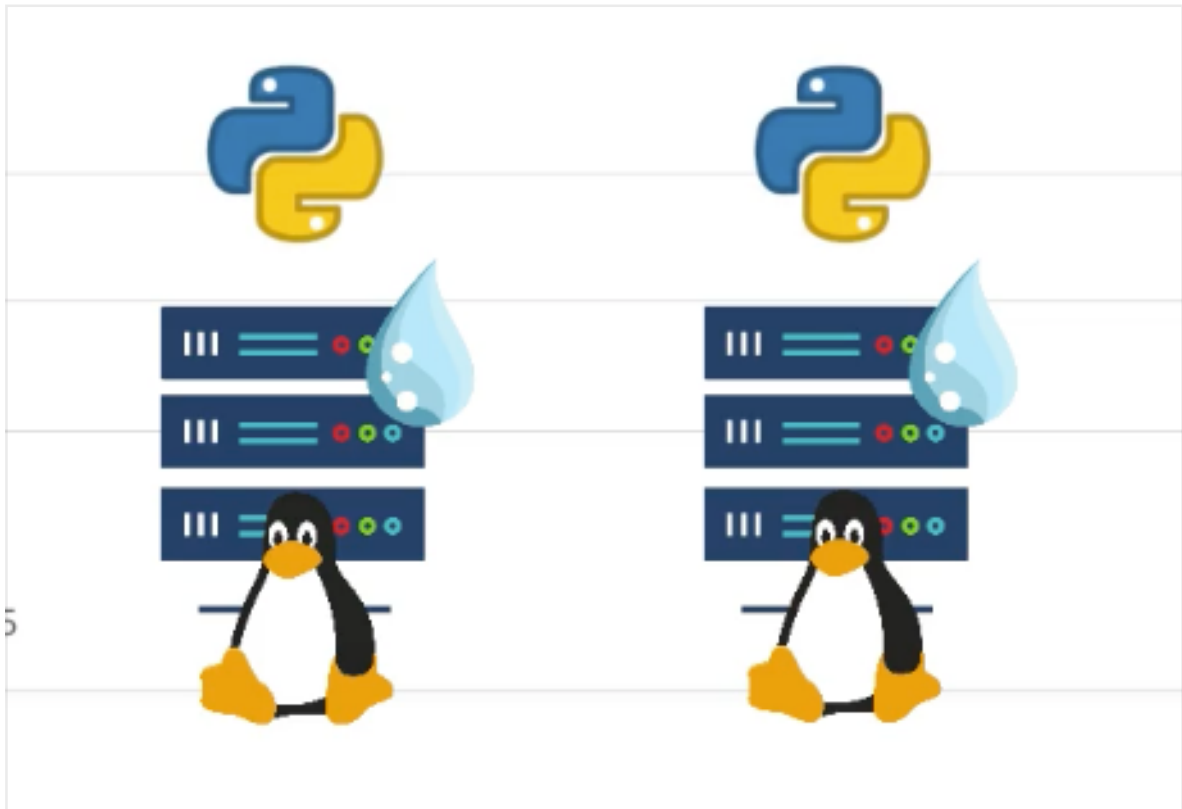

Creating the 2 droplets

Next, connect Ansible to the 2 remote servers to configure them, execute commands on them etc

So Ansible connects to the servers using SSH (agent less) but for linux servers it needs python installed to interpret Ansible as Ansible is written in python.

In the case of a windows server, powershell needs to be installed

DigitalOcean droplets are linux servers and they come with python already installed 🙌

Let's ssh into one of the servers

← Back to Droplets

CONNECTION DETAILS

Public IPv4

46.101.88.242

Private IP ⓘ

10.106.0.3

-> ssh root@46.101.88.242

```
> ssh root@46.101.88.242
The authenticity of host '46.101.88.242 (46.101.88.242)' can't be established.
ED25519 key fingerprint is SHA256:KJN/tE0ekRlT7d0ARMBYIocZVPZdjwcW26hldGH6G0A.
This key is not known by any other names
Are you sure you want to continue connecting (yes/no/[fingerprint])? yes
Warning: Permanently added '46.101.88.242' (ED25519) to the list of known hosts.
Welcome to Ubuntu 24.04.4 LTS (GNU/Linux 6.8.0-124-generic x86_64)

* Documentation:  https://help.ubuntu.com
* Management:    https://landscape.canonical.com
* Support:       https://ubuntu.com/pro

System information as of Tue Jul 14 10:38:12 UTC 2026
```

And we can see that python is already installed

```
root@ubuntu-s-1vcpu-2gb-lon1-02:~# ls /usr/bin/python3
/usr/bin/python3
root@ubuntu-s-1vcpu-2gb-lon1-02:~#
```

We are using the 'root' user. So we are connected to the server using the user 'root' which is the one we need for Ansible.
